

David did his bachelor's in computer science from XYZ University and graduated in Fall'22.

He started applying for jobs and got an interview. He landed a job as an associate full-stack developer at Silver Owl.

David was ecstatic on his first day, but by the end, he realized the knowledge was insufficient, which would affect the efficiency of the task. He was agitated and didn't know whom to approach in his workplace.

He reached out to his friend Isha and explained his problem. Isha suggested David to checkout Illuminate. She explained that it is e-learning platform for working individuals which helps individuals learn skills based on their job profile with help of free courses. One simply needs to go and search for their job role and all the skills associated with it would pop up.

David immediately opened the website and signed up, and started exploring. After searching for his job profile, the website listed all the skills associated with it. David wanted to learn ReactJS.

On selecting ReactJS, a new page opened which listed all the courses of various levels such as beginners, intermediate and advanced. Along with that it also showed project ideas he could work on after learning the concepts. He also had the option of collaborating with other individuals and connecting with a mentor, who could guide him at every step on his journey.

David thought Illuminate is a perfect solution for his problem. He started on his learning journey and implemented the concepts on multiple projects to master his abilities.

David is now confident with his skills and comfortable communicating his ideas with his team. Illuminate helped him become a better version of himself.
